What system are you building?

This project focuses on building a sports notification application that delivers real time score updates and game events to users through a mobile app. The system allows users to follow specific teams, leagues, or games and receive timely notifications when important events occur such as score changes, game start/end, and any important news.

Why are you building it?

Sports fans often want to stay updated on games they care about but are not always able to watch games live or continuously check scores. Constantly refreshing sports apps or websites can be inconvenient, and many existing platforms overwhelm users with updates they are not interested in. This system is being built to provide users with customizable, relevant, real-time updates so they can stay informed without needing to actively monitor games throughout the day.

Who are you building it for?

- Sports fans who want live score updates and game notifications
- User who follow specific teams, leagues or individual games
- Sports media platforms seeking to deliver live updates to a large user base

What problems are these customers facing and how will your system solve them?

Sports fans often miss important moments in games because they are not watching live or do not have time to repeatedly check scores. Refreshing apps or websites throughout the day is inefficient, and many users receive notifications that are irrelevant to the teams or games they care about. This can lead to missed updates or unnecessary distractions .

This system solves these problems by allowing users to subscribe only to the teams or games they are interested in and receive push notifications when relevant events occur. By delivering targeted, real time updates through a mobile app, the system ensures users stay informed while minimizing unnecessary notifications. The system also saves users time and can reduce battery usage by limiting the need to repeatedly open the app and refresh scores, since updates are delivered through notifications as they happen.

How the system is used

A user opens the mobile app and selects teams, leagues, or games that they want to follow. As game progress and important events occur, the system sends notifications

directly to the user. This allows users to stay informed without needing to constantly check on a game. There will be many different notification options to choose from. Users can customize their notification preferences by choosing which types of events they want to be updated about, such as specific news in a league or team, variety of single game alerts and can select specific events they want to be notified about, team specific updates, or team news.
